

About Menefee Humate

An organic granular soil amendment that contains humic acids, fulvic acids, and carbon. Menefee Humate is a slow-release product that breaks down in the soil over time. Its benefits typically last between 6-9 months, depending on conditions.

For over twenty-five years, Menefee Humate® has proven to be the world's premiere soil-applied humic acid product. It's easy to use, provides countless long-term benefits, and pairs well with any revegetation, reseeding or grower program to boost crop yield and improve plant health.

Menefee Humate repairs and conditions soil over time, leading to an improved growing environment for new seed, existing vegetation, and healthier plants.

Benefits of Menefee Humate

- Enhances the nutrient availability and uptake
- Improves soil structure
- Stimulates soil microorganisms
- Buffers salts and toxins in the soil
- Minimizes plant stress
- Increases water-holding capacity in soils

Product Analysis – Menefee Granular Humate®

Organic Matter	65 - 80%
Humic Acids	30 - 70%
Total Carbon	35 - 50%
Moisture Content	< 15.00%
Heavy Metal/Ash.....	< 10.00%
Particle Size.....	2 - 3 MM
Fines.....	< 2%
pH.....	3.5 - 4.5
Toxicity	Non-toxic

What sets Menefee Humate apart from other humates and humic acids?

1. **The Source.** Humic acids can vary widely in quality. Menefee Humate originates from northwest New Mexico, the world's premium source for freshwater humates. All of our products are derived from the same premium reserve, leading to consistently high quality. Our products are free of harmful salts and toxins, and they consistently test high in humic and fulvic acids.
2. **Consistent Particle Size.** Menefee Humate® goes through a multiple-screened process. The finished product is uniform in particle size, which is easy to blend and apply.

Particle Process

Menefee Humate goes through a multiple-screening process to reduce dust and ensure consistent sizing. It is available in three particle sizes. MH300 is most commonly used particle size ranging from 2-3 mm. GrowPlex is a concentrated water soluble powder option.

Application Rates

Application rates may vary due to factors such as soil type, crop type, application method, and economics.

Reclamation/Revegetation with Low Organic Matter:

400-1000 lbs./acre.

Construction & Seed Bed Preparations:

Include at a 1.0% weight to weight inclusion rate with sand, bedding and planting media.

Turf Applications:

Apply monthly at 2.5 lbs. per 1,000 ft² for at least 4 applications. Include with normal fertilization programs.

How often should it be applied?

We recommend applying Menefee Humate **1-2 times per year**. In agriculture, it's most often applied at pre-plant, post-harvest, and pre-bloom.

If you'd like an estimated application rate based on your soil's specific conditions, please call us.

Packaging

Menefee Humate is available in **50 lb. bags** (one ton minimum) and **2000 lb. super sacks**. Truckload quantities are available in 50 lb. bags, 2000 lb. super sacks, and in bulk loads.
